

Personal Web Site Project

Identify a cause about which you feel strongly and create a three-page web site about the topic. Divide the web site along logical lines. For example, if I chose animal rights as my topic, I might discuss *why* I feel passionate about rights for animals, *where* others might learn more about the topic, and *what* is the state of animal rights in the US.

Don't get bogged down too much by the content of this project; the emphasis is on *how* you present the content, not so much on the content itself.

Observe the following in both design and syntax:

Design

- You must use a triadic color scheme, either from [Adobe Color CC](#) or from [Paletton](#).
- You must use a font pairing from either [Open Font Library](#) or from [Google Fonts](#).
- You must use a fixed layout, observing divine proportion (golden ratio) or the rule of thirds.

Code

- You must employ a base/reset/normalize style sheet at the top of your style sheet stack.
- Your syntax must be well-formatted and neat.
- Your HTML syntax **must validate**.
- Your CSS **must validate**.

Submission

Submit this project as a URL from your `github.io` web site. For example, my project's URL might look like:

`https://code-warrior.github.io/intro-to-web-dev/project-1/`
