

Capture Input From User And Add Input Contents To A Row In A Table

Your task is to complete the logic of the function `addRow()` inside the file `addrow.js`.

When completed, `addRow()` will add a row into the **Receipt** table with the entries the user has entered in the form for *Qty*, *Description*, and *Cost*. Double-click `index.html` to see what I mean.

The Only Rule

- You may only add code to the designated section of the `addRow()` function in the file `addrow.js`.

The Only Tip

- You'll need the following methods, which we discussed in class yesterday and today and of which you have examples:
 - `getElementsByTagName`
 - `createElement`
 - `createTextNode`
 - `appendChild`

Due

Note: This is due right before lunch tomorrow.

Friday, 29 May, by 11:59 AM

Submission

Submit this project as a URL from your `github.io` web site. For example, my project's URL would be:
